

Founded in response to a critical requirement in the embedded software supply chain, Proven Software Solutions (PSS) is today delivering an entirely new way for developers to source enabling embedded software such as device drivers, codecs and protocol stacks. PSS's unique brokerage business model establishes a superhighway between the providers of embedded software and the OEMs who need it, enabling developers, OEMs and ODMs to maximise their investment and resources by focussing on the differentiating application layer, while at the same time reducing risk, cost and time to market.

Providing a headstart

Proven Software Solutions believes that any resources spent developing embedded software should add value to the end product. The reality is however that a great deal of essential software adds little or no perceivable value to the end product. Proven Software Solutions focuses on sourcing, supplying and supporting enabling functions like device drivers, codecs and protocol stacks together with a host of other middleware so that, in a nutshell, its customers don't have to. By providing only proven and transportable code, PSS ensures that developers are able to concentrate on the essential added-value aspects of their project, instead of constantly having to reinvent the wheel.

Software Search	•Search PSS' online database for available software
Software Wanted	•If a particular software component is not shown then customers can post a Wanted Ad with no charge or obligation
Software Licensing	•License proven software components
Software Components	•PSS can turn OEMs existing embedded software into reusable components for in-house re-use or for submission to PSS for brokering
Software Brokering	•Software owners will enjoy a return each time their software is licensed
Design Services	•PSS can provide expertise to help with the design phase
Legacy Software Porting	•For customers tied into old silicon because of legacy software

Developed, debugged and deployed

PSS only offers proven software that has been fully developed, debugged and deployed: Customers are able to search the Company's database by function, target architecture, language and operating system. The IDE used is fully documented, as is any other critical aspect of the software.
